Question: 12.13.2.5

Problem Statement:
A die marked 1, 2, 3 in red and 4, 5, 6 in green is tossed. Let A be the event,'the number is even,' and B be the event, 'the number is red'. Are A and B independent?
Solution:
Given,
'S'= Sample space = $\{1, 2, 3, 4, 5, 6\}$
'A'= Event that number is even = $\{2, 4, 6\}$
'B'= Event that number is red = $\{1, 2, 3\}$

$$n(A) = 3 \tag{1}$$

$$n(B) = 3 \tag{2}$$

$$n(S) = 6 \tag{3}$$

$$n(AB) = 1 \tag{4}$$

Let X and Y be two random variables such that,

$$X = \begin{cases} 0, & \text{if number is odd} \\ 1, & \text{if number is even} \end{cases} \tag{5}$$

$$Y = \begin{cases} 0, & \text{if number is green} \\ 1, & \text{if number is red} \end{cases} \tag{6}$$

Now,

$$\Pr(X = 1) = \frac{n(A)}{n(S)} = \frac{3}{6} = \frac{1}{2} \tag{7}$$

$$\Pr(Y = 1) = \frac{n(B)}{n(S)} = \frac{3}{6} = \frac{1}{2} \tag{8}$$

$$\Pr(X = 1, Y = 1) = \frac{n(AB)}{n(S)} = \frac{1}{6} \tag{9}$$

Now,

$$\Pr(X = 1) \times \Pr(Y = 1) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \tag{10}$$

$$\implies \Pr(X = 1, Y = 1) \neq \Pr(X = 1) \times \Pr(Y = 1) \tag{11}$$

Hence, A and B are not independent.
